

Student Organization System

Build one system to run events, members and money in one place.

1) The Challenge

Your task is to build **one unified software platform** that solves the real, day-to-day problems of running a student organization. Think of it as the **digital backbone** of a busy campus club. Read the scenes that follow as things that actually happen during a normal semester, and design the system that makes each of them easy.

2) Meet the Skyline Student Association

The Skyline Student Association **runs events, sells memberships and merchandise**, and manages a **small budget raised from dues, ticket sales and fundraisers**. New students join every month, volunteers plan events on the side, and the leadership team is elected every year. Everyone involved is a student with classes to attend, so **nothing about running the club should take more time than it has to**.

How Things Run Today

- **Member sign-ups:** Tracked in a spreadsheet
- **Event tickets:** Sold at the door for cash
- **Club budget:** Tracked in a notebook
- **Announcements:** Sent one by one on WhatsApp
- **Volunteer expenses:** Reimbursed after chasing receipts

Members lose track of events, money goes missing, and nobody knows who still owes what.

3) A Semester with the Club

The scenes below follow one semester with the Skyline Student Association, from a new student signing up to the treasurer closing the books. **Every one of them is a problem someone in the club faces today.**

A new student joins

Someone signs up at a table on campus. The club needs to know who they are, **whether they have paid their dues**, and **what that membership gets them**, like discounts on tickets and merchandise.

Memberships run out at the end of the year, and someone should be **reminded to renew before it lapses**. Whenever a member turns up at an event, it should be **easy to check that they are, in fact, a member**.

Selling tickets for the spring gala

The club is hosting its biggest event of the year. Tickets need to **go on sale online**, with **different prices for members and non-members**, and **a limit on how many seats are left**.

On the night, someone at the door should be able to **check a ticket in seconds, without a printed list**. After the event, the club wants to know **how many people actually showed up, and how much the event made**.

Announcing the next meeting

The club needs to tell every member about a meeting, a deadline, or a change of plan. Right now, someone **types the same message into several WhatsApp groups** and hopes everyone sees it.

A simple website and a mailing list would let the club post **one announcement that reaches everyone**, and **keep a record of what was said and when**, instead of it getting lost in a chat.

Ordering hoodies for the club

The club wants to sell branded hoodies and T-shirts to members. Someone needs to **collect sizes, take orders and payment**, and know **how many of each size are actually left in stock**.

Selling online would let members **order from their phones, at any hour**, without someone manually noting down every order on paper and chasing people for payment afterwards.

Planning a fundraiser

A small team of volunteers is organizing a bake sale to raise money for the club. **Tasks need to be split up**: who is baking, who is buying supplies, who is managing the table on the day.

Someone should be able to see, at a glance, **what still needs to be done, who is doing it, and whether the fundraiser is on track**, instead of everything living in someone's head or a group chat.

The treasurer, at the end of the semester

The treasurer needs to **explain where the club's money went**: dues collected, tickets sold, merchandise sold, and every expense a volunteer was reimbursed for.

Right now, that means going through a notebook and a pile of receipts. The club wants one place that shows **what came in, what went out, and how much is left**, so anyone on the team can **understand it at a glance**.
